Water Consumption Report - Monthly - September 2026

nanneer global

This report analyzes water consumption patterns including total consumption, average daily consumption, and alerts for all items in the module.

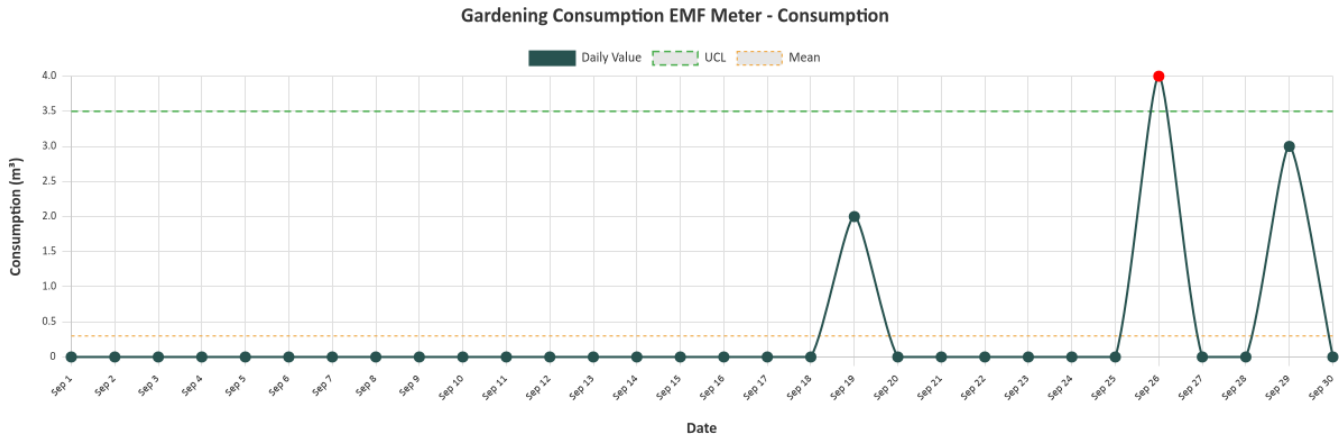

Executive Summary

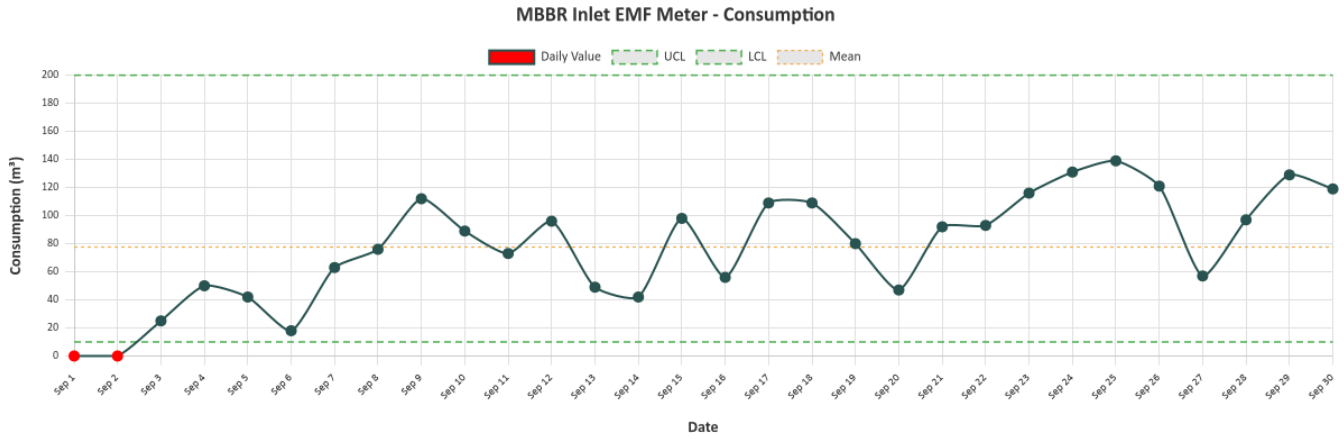

Parameter	Value
Total Consumption	4932.00 m³
Average Daily Consumption	164.40 m³
Total Alerts	0

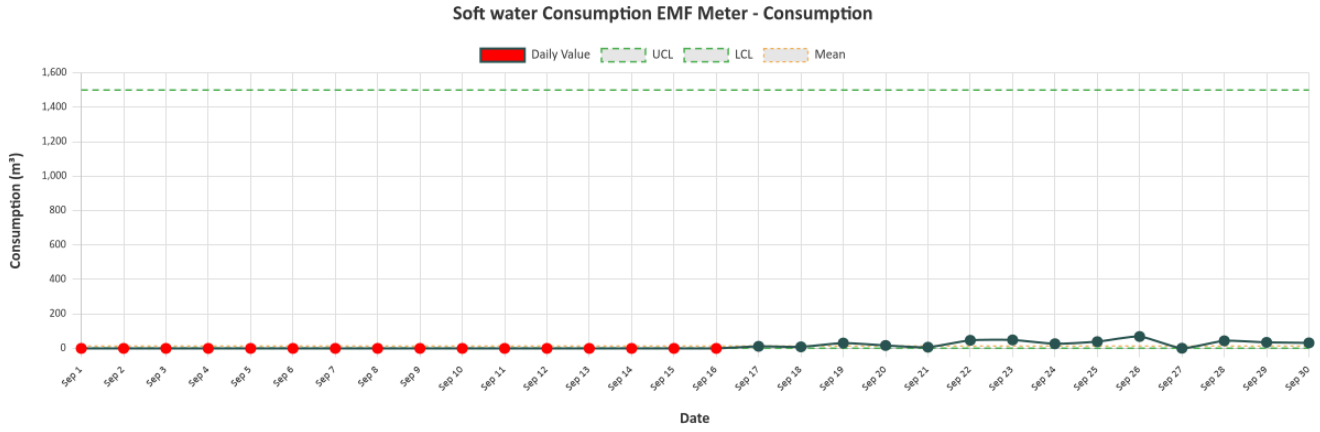

Descriptive Statistics

Item	Minimum Consumption (m³)	Maximum Consumption (m³)	Total Consumption (m³)
Gardening Consumption EMF Meter	0.00	4.00	9.00
MBBR Inlet EMF Meter	0.00	139.00	2328.00
Soft water Consumption EMF Meter	0.00	69.00	419.00
Filter Feed Treated EMF Meter	0.00	108.00	1587.00
SBR Inlet EMF meter	0.00	22.00	24.00
FLushing Consumption EMF meter	0.00	60.00	565.00

Total Water Consumption Trend

Daily total water consumption across all items

Consumption Distribution

water consumption breakdown by item

Per-Item Variability Analysis

Detailed analysis of consumption variability for each item in this module

Overview: This section provides item-level analysis of water consumption variability. Each item's consumption patterns are evaluated using statistical measures including standard deviation, variance, and coefficient of variation (CV). Items with CV >= 20% are considered to have high variability and may require attention. Out of 6 items analyzed, 6 items have been identified with high variability.

Item Name	Mean (KL)	Std Dev (KL)	Variance (KL)	CV (%)	Range (KL)	Category
Filter Feed Treated EMF Meter	52.90 KL	35.66 KL	1271.82 KL	67.42%	108.00 KL	High Variability
FLushing Consumption EMF meter	18.83 KL	18.15 KL	329.27 KL	96.35%	60.00 KL	High Variability
Gardening Consumption EMF Meter	0.30 KL	0.94 KL	0.88 KL	312.10%	4.00 KL	High Variability
MBBR Inlet EMF Meter	77.60 KL	38.19 KL	1458.11 KL	49.21%	139.00 KL	High Variability
SBR Inlet EMF meter	0.80 KL	3.94 KL	15.56 KL	493.08%	22.00 KL	High Variability
Soft water Consumption EMF Meter	13.97 KL	19.56 KL	382.63 KL	140.05%	69.00 KL	High Variability

SBR Inlet EMF meter - Process Stability Analysis

Analysis of process stability using the Coefficient of Variation (CV) metric

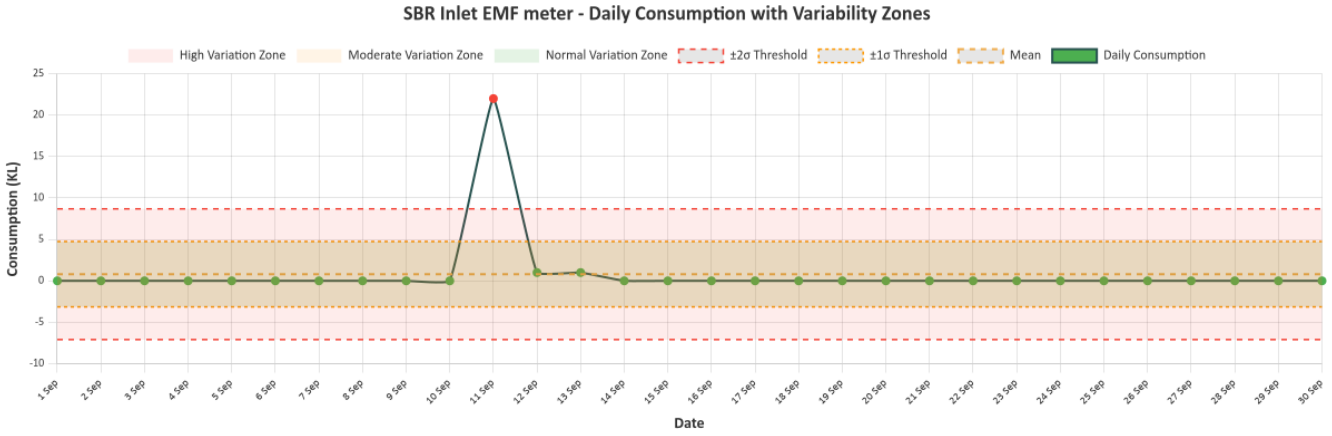

Coefficient of Variation (CV) Methodology: The Coefficient of Variation is a standardized measure of variability, calculated as CV = (Standard Deviation / Mean) × 100%. It provides a relative measure of variability that is independent of the scale of measurement. Lower CV values indicate more stable and consistent processes, while higher values suggest greater variability and potential optimization opportunities.

Coefficient of Variation

493.08%

CV Scale Reference

Very Stable	Stable	Moderate	High Variability
< 10%	10 - 20%	20 - 30%	> 30%

Statistical Summary

Mean Consumption	0.80 KL
Standard Deviation	3.94 KL
Variance	15.56 KL
Coefficient of Variation (CV)	493.08%
Range (Variation)	22.00 KL
CV Category	High Variability

Consistency Analysis

Days Within ±1s (Normal Variation)	29 days (96.67%)
Days Within ±2s (Moderate Variation)	29 days (96.67%)
Days with High Variability	1 days (3.33%)

Soft water Consumption EMF Meter - Process Stability Analysis

Analysis of process stability using the Coefficient of Variation (CV) metric

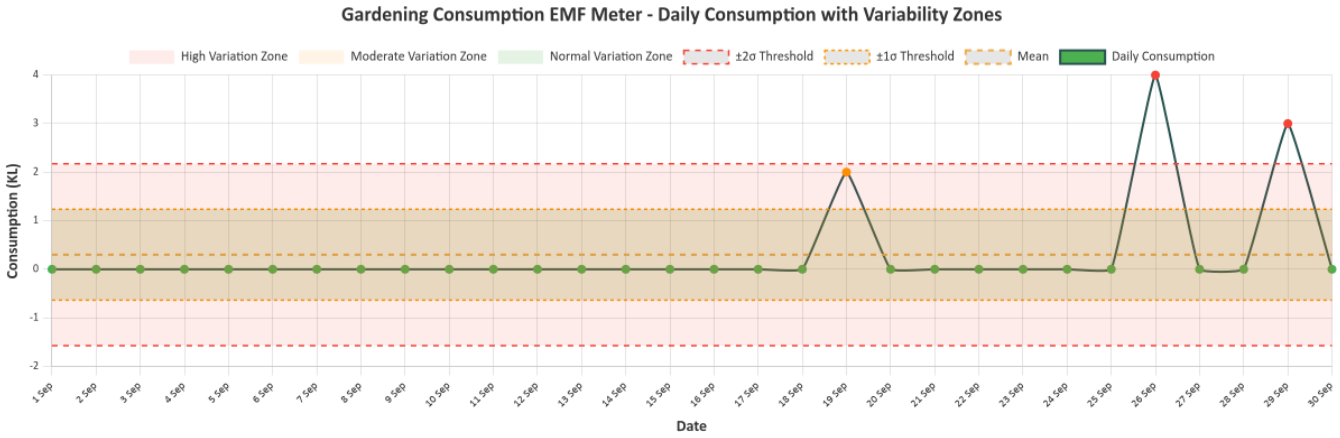

Coefficient of Variation (CV) Methodology: The Coefficient of Variation is a standardized measure of variability, calculated as CV = (Standard Deviation / Mean) × 100%. It provides a relative measure of variability that is independent of the scale of measurement. Lower CV values indicate more stable and consistent processes, while higher values suggest greater variability and potential optimization opportunities.

Coefficient of Variation

140.05%

CV Scale Reference

Very Stable	Stable	Moderate	High Variability
< 10%	10 - 20%	20 - 30%	> 30%

Statistical Summary

Mean Consumption	0.30 KL
Standard Deviation	0.94 KL
Variance	0.88 KL
Coefficient of Variation (CV)	312.10%
Range (Variation)	4.00 KL
CV Category	High Variability

Consistency Analysis

Days Within ±1s (Normal Variation)	24 days (80.00%)
Days Within ±2s (Moderate Variation)	29 days (96.67%)
Days with High Variability	6 days (20.00%)

Soft water Consumption EMF Meter - Process Stability Analysis

Analysis of process stability using the Coefficient of Variation (CV) metric

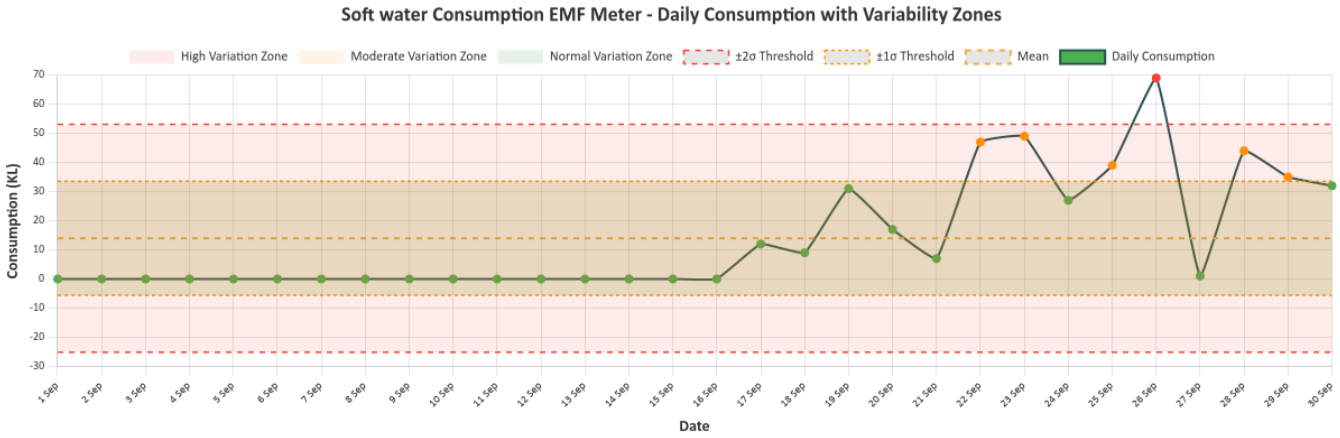

Coefficient of Variation (CV) Methodology: The Coefficient of Variation is a standardized measure of variability, calculated as CV = (Standard Deviation / Mean) × 100%. It provides a relative measure of variability that is independent of the scale of measurement. Lower CV values indicate more stable and consistent processes, while higher values suggest greater variability and potential optimization opportunities.

Coefficient of Variation

140.05%

CV Scale Reference

Very Stable	Stable	Moderate	High Variability
< 10%	10 - 20%	20 - 30%	> 30%

Statistical Summary

Mean Consumption	13.97 KL
Standard Deviation	19.56 KL
Variance	382.63 KL
Coefficient of Variation (CV)	140.05%
Range (Variation)	69.00 KL
CV Category	High Variability

Consistency Analysis

Days Within ±1s (Normal Variation)	24 days (80.00%)
Days Within ±2s (Moderate Variation)	29 days (96.67%)
Days with High Variability	6 days (20.00%)

Filter Feed Treated EMF Meter - Process Stability Analysis

Analysis of process stability using the Coefficient of Variation (CV) metric

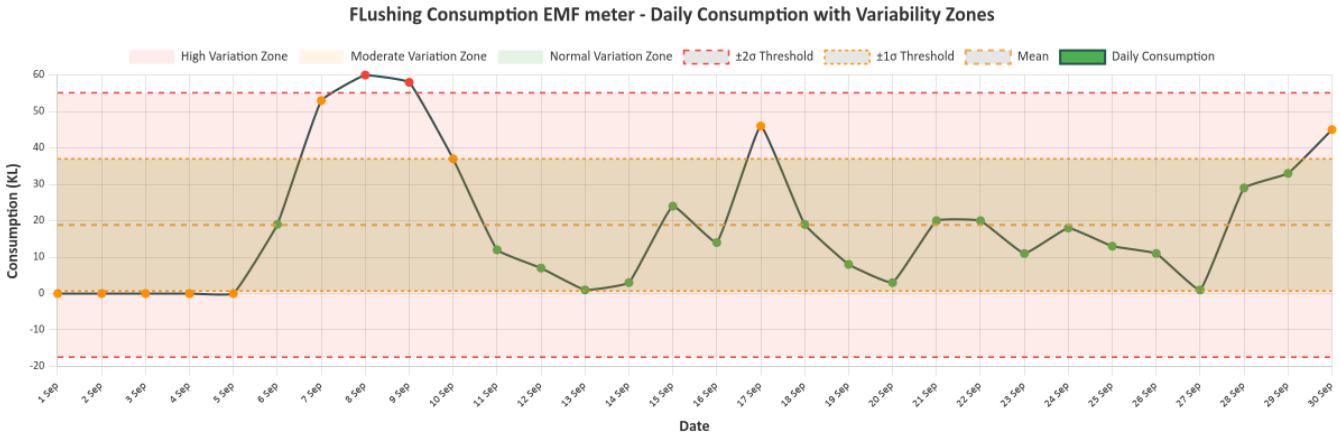

Coefficient of Variation (CV) Methodology: The Coefficient of Variation is a standardized measure of variability, calculated as CV = (Standard Deviation / Mean) × 100%. It provides a relative measure of variability that is independent of the scale of measurement. Lower CV values indicate more stable and consistent processes, while higher values suggest greater variability and potential optimization opportunities.

Coefficient of Variation

67.42%

CV Scale Reference

Very Stable	Stable	Moderate	High Variability
< 10%	10 - 20%	20 - 30%	> 30%

Statistical Summary

Mean Consumption	18.83 KL
Standard Deviation	18.15 KL
Variance	329.27 KL
Coefficient of Variation (CV)	96.35%
Range (Variation)	60.00 KL
CV Category	High Variability

Consistency Analysis

Days Within ±1s (Normal Variation)	24 days (80.00%)
Days Within ±2s (Moderate Variation)	29 days (96.67%)
Days with High Variability	6 days (20.00%)

Filter Feed Treated EMF Meter - Process Stability Analysis

Analysis of process stability using the Coefficient of Variation (CV) metric

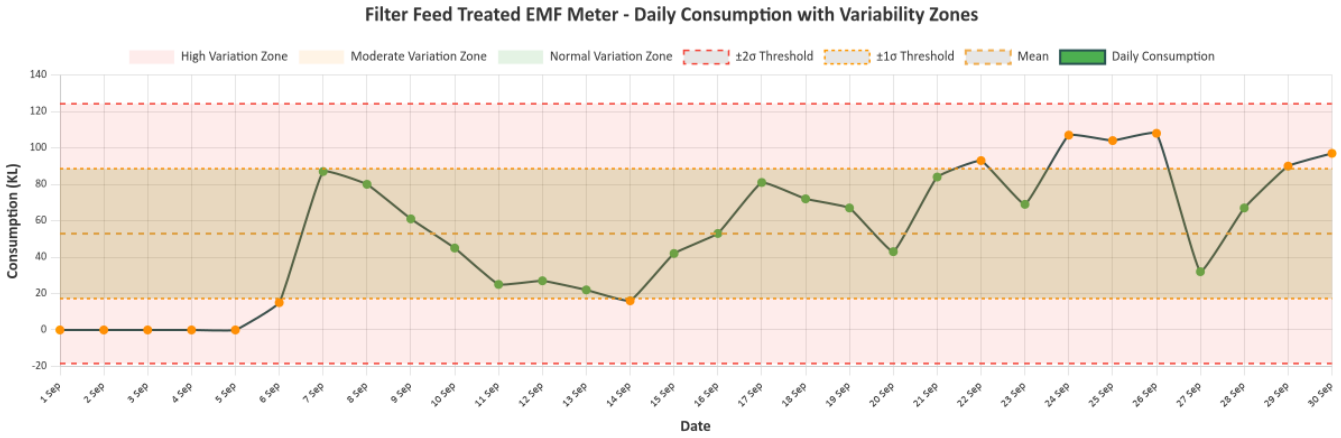

Coefficient of Variation (CV) Methodology: The Coefficient of Variation is a standardized measure of variability, calculated as CV = (Standard Deviation / Mean) × 100%. It provides a relative measure of variability that is independent of the scale of measurement. Lower CV values indicate more stable and consistent processes, while higher values suggest greater variability and potential optimization opportunities.

Coefficient of Variation

67.42%

CV Scale Reference
